

Vector and matrix derivatives

Herman Kamper

<http://www.kamperh.com/>

Main idea

How do we find minimum of a scalar function?

$$\text{Set } \frac{df}{dx} = 0.$$

And for a function of two variables?

$$\text{Set } \frac{\partial f}{\partial x_1} = 0$$

$$\text{set } \frac{\partial f}{\partial x_2} = 0$$

$$\frac{\partial f}{\partial \underline{x}} = ?$$

- What if we have a function with N variables?
- Functions with intermediate variables?
- Functions producing a vector as output instead of a scalar?

Main idea:

Define vector and matrix derivatives to allow us to differentiate directly in vector/matrix form.

Definitions

- Derivative of a scalar function $f : \mathbb{R}^N \rightarrow \mathbb{R}$ with respect to vector $\mathbf{x} \in \mathbb{R}^N$:

$$\frac{\partial f(\underline{x})}{\partial x_i} = \left[\frac{\partial f_1(\underline{x})}{\partial x_i} \dots \frac{\partial f_M(\underline{x})}{\partial x_i} \right]$$

$$\frac{\partial f(\mathbf{x})}{\partial \mathbf{x}} \triangleq \begin{bmatrix} \frac{\partial f(\mathbf{x})}{\partial x_1} \\ \frac{\partial f(\mathbf{x})}{\partial x_2} \\ \vdots \\ \frac{\partial f(\mathbf{x})}{\partial x_N} \end{bmatrix}$$

$$\underline{f}(\underline{x}) = [f_1(\underline{x}) \ f_2(\underline{x}) \ \dots \ f_M(\underline{x})]^T$$

- Derivative of a vector function $\mathbf{f} : \mathbb{R}^N \rightarrow \mathbb{R}^M$ with respect to vector $\mathbf{x} \in \mathbb{R}^N$:

$$\frac{\partial \mathbf{f}(\mathbf{x})}{\partial \mathbf{x}} \triangleq \begin{bmatrix} \frac{\partial \mathbf{f}(\mathbf{x})}{\partial x_1} \\ \frac{\partial \mathbf{f}(\mathbf{x})}{\partial x_2} \\ \vdots \\ \frac{\partial \mathbf{f}(\mathbf{x})}{\partial x_N} \end{bmatrix} = \begin{bmatrix} \frac{\partial f_1(\mathbf{x})}{\partial x_1} & \frac{\partial f_2(\mathbf{x})}{\partial x_1} & \dots & \frac{\partial f_M(\mathbf{x})}{\partial x_1} \\ \frac{\partial f_1(\mathbf{x})}{\partial x_2} & \frac{\partial f_2(\mathbf{x})}{\partial x_2} & \dots & \frac{\partial f_M(\mathbf{x})}{\partial x_2} \\ \vdots & \vdots & \vdots & \vdots \\ \frac{\partial f_1(\mathbf{x})}{\partial x_N} & \frac{\partial f_2(\mathbf{x})}{\partial x_N} & \dots & \frac{\partial f_M(\mathbf{x})}{\partial x_N} \end{bmatrix}$$

Definitions

- Derivative of a scalar function $f : \mathbb{R}^{M \times N} \rightarrow \mathbb{R}$ with respect to matrix $\mathbf{X} \in \mathbb{R}^{M \times N}$:

$$\frac{\partial f(\mathbf{X})}{\partial \mathbf{X}} \triangleq \begin{bmatrix} \frac{\partial f(\mathbf{X})}{\partial X_{1,1}} & \frac{\partial f(\mathbf{X})}{\partial X_{1,2}} & \cdots & \frac{\partial f(\mathbf{X})}{\partial X_{1,N}} \\ \frac{\partial f(\mathbf{X})}{\partial X_{2,1}} & \frac{\partial f(\mathbf{X})}{\partial X_{2,2}} & \cdots & \frac{\partial f(\mathbf{X})}{\partial X_{2,N}} \\ \vdots & \vdots & \vdots & \vdots \\ \frac{\partial f(\mathbf{X})}{\partial X_{M,1}} & \frac{\partial f(\mathbf{X})}{\partial X_{M,2}} & \cdots & \frac{\partial f(\mathbf{X})}{\partial X_{M,N}} \end{bmatrix}$$

Transpose of
the Jacobian
matrix

- Using the above definitions, we can generalise the chain rule. Given $\mathbf{u} = h(\mathbf{x})$ (i.e. \mathbf{u} is a function of \mathbf{x}) and \mathbf{g} is a vector function of \mathbf{u} , the vector-by-vector chain rule states:

$$\frac{\partial \mathbf{g}(\mathbf{u})}{\partial \mathbf{x}} = \frac{\partial \mathbf{u}}{\partial \mathbf{x}} \frac{\partial \mathbf{g}(\mathbf{u})}{\partial \mathbf{u}}$$

Order matters!

Common identities:

$$\frac{\partial(u(\mathbf{x}) + v(\mathbf{x}))}{\partial \mathbf{x}} = \frac{\partial u(\mathbf{x})}{\partial \mathbf{x}} + \frac{\partial v(\mathbf{x})}{\partial \mathbf{x}}$$

$$\frac{\partial \mathbf{A} \mathbf{x}}{\partial \mathbf{x}} = \mathbf{A}^\top$$

$$\frac{\partial \mathbf{x}^\top \mathbf{a}}{\partial \mathbf{x}} = \mathbf{a}$$

$$\frac{\partial \mathbf{x}^\top \mathbf{A} \mathbf{x}}{\partial \mathbf{x}} = (\mathbf{A} + \mathbf{A}^\top) \mathbf{x}$$

$$\frac{\partial \mathbf{x}^\top \mathbf{A} \mathbf{x}}{\partial \mathbf{x}} = 2\mathbf{A} \mathbf{x} \text{ if } \mathbf{A} \text{ is symmetric}$$

$$\frac{\partial |\mathbf{X}|}{\partial \mathbf{X}} = |\mathbf{X}| (\mathbf{X}^{-1})^\top$$

$$\frac{\partial \ln |\mathbf{X}|}{\partial \mathbf{X}} = (\mathbf{X}^{-1})^\top$$

Example derivation:

What is $\frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial \underline{\mathbf{x}}}$ with $\underline{\mathbf{a}}$ a constant N -dimensional column vector?

$$\frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial x_i} = \frac{\partial}{\partial x_i} \sum_{n=1}^N x_n a_n = a_i$$

$$\frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial \underline{\mathbf{x}}} = \begin{bmatrix} \frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial x_1} \\ \vdots \\ \frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial x_N} \end{bmatrix} = \begin{bmatrix} a_1 \\ a_2 \\ \vdots \\ a_N \end{bmatrix} = \underline{\mathbf{a}}$$

$$\therefore \boxed{\frac{\partial \underline{\mathbf{x}}^\top \underline{\mathbf{a}}}{\partial \underline{\mathbf{x}}} = \underline{\mathbf{a}}}$$

Where to find identities
